6.24.	WAVE sensor (R).....	102
6.25.	FLTRIDER sensor	104

1. Revision history

Revision	Release date	Notes	Author
1.0	2017-09-04	Original	C. SCHAEFFER
1.1	2018-02-15	Upgrade of technical information: <ul style="list-style-type: none"> - Adding internal temperature information in [SYSTEM] - Adding pressure activation information in [ACTIVATION] - Adding nke ID information in [USER] - Changing grounding information during navigation phases in [PROFILE] and [ALARM] - Changing feedback information in [ALARM] 	C. SCHAEFFER
1.2	2018-11-19	Upgrade of technical information: <ul style="list-style-type: none"> - Adding pressure reference in "VBatt peak min" tag - Adding USEA identification in [USER] - Adding sensor identification [SENSOR_xxx] - Adding surface sample count in [DATA] - Adding sensor tag in [POWER] - Adding alarms flag in [ALARM] Upgrade of sensor data files: <ul style="list-style-type: none"> - Adding navigation phase [SURFACE] - Adding decimated raw treatment tag (DW) - Adding a 100 dbar offset in SBE41 pressure - Adding DO, OCR, ECO, C-ROVER, SBEPH, SUNA data format 	C. SCHAEFFER
1.3	2019-12-12	Upgrade of technical information: <ul style="list-style-type: none"> - Adding metadata files - Removing redundant information [USER] - Removing redundant information [SENSOR_xxx] - Changing "kB" into "KB" Upgrade of sensor data files <ul style="list-style-type: none"> - Adding UVP6 data formats Update SBE41 *.hex standard format: <ul style="list-style-type: none"> - Adding time stamping for each record Upgrade of technical information: <ul style="list-style-type: none"> - Adding ice capabilities alarms 	C. SCHAEFFER
1.4	2020-01-20	Upgrade of sensor data files <ul style="list-style-type: none"> - Adding EXTTRIG data format 	C. SCHAEFFER
1.5	2020-02-11	Upgrade of sensor data files <ul style="list-style-type: none"> - Adding ECOv2 data format - Adding technical and metadata information related to ECOv2 	C. SCHAEFFER
1.6	2020-03-12	Upgrade of technical information <ul style="list-style-type: none"> - Adding ice braking and perigee in [PROFILE] - Adding alarm flag in [ALARM] 	C. SCHAEFFER
1.7	2020-08-26	The following are the changes to this manual from the previous revision to document the firmware update: APMT v1.08.004 - USEA v1.01.004 Upgrade of technical and sensor data files	C. SCHAEFFER

		- Adding RAMSES data format	
1.8	2020-09-30	Upgrade of metadata file: <ul style="list-style-type: none"> - Changing profiler model format - Adding APMT's SD card information - Adding BATTERY information - Adding SBE41 firmware information 	C. SCHAEFFER
1.9	2020-12-16	The following are the changes to this manual from the previous revision to document the firmware update: APMT v1.08.005 - USEA v1.01.005 Upgrade of technical and sensor data files <ul style="list-style-type: none"> - Adding OPUS data format Upgrade of metadata file: <ul style="list-style-type: none"> - Adding PROFILER.ID information - Adding TELECOM.Login information - Adding ECO.Type information - Adding EXTENSION_BOARD information - Adding HULL information - Adding SBE41 calibration coefficients - Adding CONTROL_BOARD and MEASURE_BOARD SN information 	C. SCHAEFFER
1.10	2021-04-07	The following are the changes to this manual from the previous revision to document the firmware update: APMT v1.09.001 - USEA v1.02.001 Upgrade of technical and sensor data files <ul style="list-style-type: none"> - Adding MPE data format - Adding [POWER].Measure information 	C. SCHAEFFER
1.11	2021-09-02	The following are the changes to this manual from the previous revision to document the firmware update: APMT v1.09.002 - USEA v1.02.002 Upgrade of technical and sensor data files <ul style="list-style-type: none"> - Adding SBEPH technical information - Changing UVP6 LPM, TXO and BLK data format for UVP6 version 2 - Adding UVP6-TXO technical information - Deleting UVP6-TX1 and UVP6-TX2 - Changing UVP6 metadata format 	C. SCHAEFFER
1.12	2021-11-09	The following are the changes to this manual from the previous revision to document the firmware update: APMT v1.09.003 - USEA v1.02.003 Upgrade of technical and sensor data files <ul style="list-style-type: none"> - Adding HYDROC technical information - Adding HYDROC data format 	C. SCHAEFFER
1.13	2022-02-07	The following are the changes to this manual from the previous revision to document the firmware update: APMT v1.09.004 - USEA v1.02.004 Upgrade of technical and sensor data files	C. SCHAEFFER

		<ul style="list-style-type: none"> - Adding RAMSES2 technical information - Adding RAMSES2 data format - Adding IMU technical information - Adding IMU data format - Changing UVP6-TXO data format - Changing HYDROC's pump power resolution 	
1.14	2022-06-16	Upgrade of technical and sensor data files <ul style="list-style-type: none"> - Updating IMU data format - Adding WAVE technical information - Adding WAVE format 	C. SCHAEFFER
1.15	2022-06-17	Upgrade of technical and sensor data files <ul style="list-style-type: none"> - Adding FLTRIDER technical information - Adding FLTRIDER data format 	C. SCHAEFFER

1.1 Firmware upgrade

The following are the main changes to embedded software:

APMT	USEA	Notes
1.08.002	1.01.002	Adding Under Ice capabilities
1.08.003	1.01.003	Adding ECOv2 sensor
1.08.004	1.01.004	Adding RAMSES sensor
1.08.005	1.01.005	Adding OPUS sensor
1.09.000	1.02.000	Adding Multi-Parking capabilities
1.09.001	1.02.001	Adding MPE sensor
1.09.002	1.02.002	Updating UVP6 sensor
1.09.003	1.02.003	Adding HYDROC sensor
1.09.004	1.02.004	Adding RAMSES2 sensor Adding IMU sensor
1.09.005	1.02.005	Adding FLTRIDER sensor

2. File system

Float management is based on a specific file system developed by nke. This file system allows information and data to be stored when the float is turned off, together with the mission configuration.

These files can be accessed by an FTP client via the Bluetooth connection.

2.1 Memory organisation

The memory space is divided into different areas intended for different uses. In particular, the following spaces can be found:

- Reserved: restricted system use to store file manipulation and management information
- Working: used for temporary storage (awaiting transmission).
- Storage (optional): used to expand the temporary storage capacity of the workspace

2.2 File types

The system uses various file types, as needed:

- Configuration file for mission and sensor settings
- Sensor data files (raw, processed and transmitted data)
- Technical data files
- Metadata files (for sensor specific identification)
- Execution trace files (mission progress monitoring)
- Specific files (restricted system use)

2.3 Main memory – Working memory

The working memory (fast access) is itself divided into two physical spaces:

- Area for repeated access files: used for files with recurring access (configuration file...)
- Area for temporary files: used mainly for the generation of sensor information and data during the various navigation phases (a process that automatically deletes the oldest files in favour of new ones allows a minimum free memory space to be maintained)

2.4 Extended memory – Storage memory (optional)

When the application requires it, the use of an additional memory (slow access) allows the storage capacity of the system to be increased.

In this case, the files (awaiting transmission) deleted from the working memory are moved to the extended memory. They will then be repatriated to the working memory (for transmission) when the main memory space is sufficient.

3. Configuration files

The mission configuration is saved as a text file organised by sections and tags.

3.1 Local configuration via Bluetooth

During the mission configuration phase performed locally via Bluetooth, this file can be written and/or modified by the user. It can be manually uploaded in full using an FTP client or partially modified with a TELNET command interpreter.

3.2 Remote configuration via remote commands

When the mission is in progress, the file can be modified by sending remote commands via the satellite communication system (RUDICS...).

3.3 Transmission of the configuration file

The system transmits the current configuration file at various stages of the mission:

- At the start of the mission (initial configuration)
- Upon a change of configuration following the application of a remote command or pre-programmed change (script)

The various files generated are named using the format "xxxx_ccc_mm_apmt.ini", with:

- "xxxx": float's hexadecimal serial number (4 characters)
- "ccc": cycle number (3 characters)
- "mm": pattern number (2 characters)

4. Technical files

The various pieces of technical information associated with a profile are saved in a text file organised by sections.

4.1 Transmission of technical information

The system transmits technical files at various stages of the mission:

- During system verification prior to the mission (self-test)
- During the mission at the end of each pattern
- At end of life

4.1.1. Self-test files

The files generated are named using the format "xxxx_ccc_autotest_nnnnn.txt", with:

- "xxxx": float's hexadecimal serial number (4 characters)
- "ccc": cycle number (3 characters)
- "nnnnn": identification of self-test file number associated with the cycle (5 characters)

4.1.2. Mission files

The files generated are named using the format "xxxx_ccc_mm_technical.txt":

- "xxxx": float's hexadecimal serial number (4 characters)
- "ccc": cycle number (3 characters)
- "mm": pattern number (2 characters)

Note: A pattern numbered "00" corresponds to a pre-mission file.

4.1.3. End-of-life files

The various files generated are named using the format "xxxx_ccc_mm_default_nnnnn.txt", with:

- "xxxx": float's hexadecimal serial number (4 characters)
- "ccc": cycle number (3 characters)
- "mm": pattern number (2 characters)
- "nnnnn": identification of end-of-life file number associated with the cycle/pattern pair (5 characters)

4.2 Technical information available

The data is organised in sections. The various sections and fields that compose them are optional and may not be present in the files.

[SYSTEM]

Information	Format
External pressure offset	Pe offset=xx.xx dbar
Internal pressure	Pi=xxx.x mbar
No-load battery voltage	Vbatt=xx.x V
Battery voltage under load (min.)	Vbatt peak min=xx.x V (xx dbar)
External temperature (air)	Te air=xx.x degC
External pressure (air)	Pe air=xx.x dbar
Internal temperature	Ti=xx.x degC

[GPS]

Information	Format
Time stamping, position (*) and clock drift (**)	UTC=yy-mm-dd hh:mm:ss Lat=ddmm.mmmmmh Long=dddmm.mmmmmh Clock drift=xx.xxx s

(*) Geographic coordinates are coded in DM format (degrees, minutes and decimal minutes – NMEA standard). For example: “Lat=4747.846N Long=00317.160W” represents 47°47.846’N 3°17.160’W coordinates.

(**) Drift = Float time - GPS time. The offset is reset to 0 after every GPS retiming.

[USER]

Information	Format
nke ID	WC=xxxxxxxxxx

[ACTIVATION]

Information	Format
Pressure activation start	UTC=yy-mm-dd hh:mm:ss Detection start
Pressure activation stop	UTC=yy-mm-dd hh:mm:ss Detection stop

5. Metadata files

5.1. Transmission of metadata information

Metadata files are transmitted once at the beginning of the mission.

The files generated are named using the format "xxxx_ccc_mm_metadata.xml", with:

- "xxxx": float's hexadecimal serial number (4 characters)
- "ccc": cycle number (3 characters)
- "mm": pattern number (2 characters)

5.2. Metadata information available

Metadata information are organised in XML format.

6. Sensor data files

The system can generate sensor data files under three formats:

- Text format (*.csv)
- Standard binary format (*.hex)
- Extended binary format (*.hex)

6.1. Transmission of sensor data

The various sensor data files generated are named using the format "xxxx_ccc_mm_ssssss.ext", with:

- "xxxx": float's hexadecimal serial number (4 characters)
- "ccc": cycle number (3 characters)
- "mm": pattern number (2 characters)
- "sssss": sensor ID (N characters, e.g. "sbe41")
- "ext": file extension

All data from a sensor are saved in a unique data file associated to the cycle/pattern.

6.2. ID tags

All files are organised in sections using ID tags for the phase and processing type.

6.2.1. Navigation phase identification

At every change of navigation phase, an ID string is inserted. The various ASCII strings are as follows:

- **[DESCENT]**: Data from the descent phase, from the surface to the drift depth
- **[PARK]**: Data from the drift phase
- **[DEEP_PROFILE]**: Data from the descent phase, from the drift depth to the measurement depth
- **[SHORT_PARK]**: Data from the drift phase, from the drift depth to the measurement depth
- **[ASCENT]**: Data from the ascent phase
- **[SURFACE]**: Data from the surface phase

6.2.2. Processing type identification

At every change of phase or processing area, an ID string for the processing type is inserted. The various ASCII strings are as follows:

- **(RW)**: For raw data
- **(DW)**: For decimated raw data
- **(AM)**: For arithmetic mean
- **(SD)**: For standard deviation
- **(MD)**: For median
- **(SS)**: For subsurface point

Several processing types can follow one another. The combinations are as follows:

- (RW)
- (DW)
- (AM)
- (AM)(SD)
- (AM)(MD)
- (AM)(SD)(MD)
- (SS)

6.3. Recording in text format

Spreadsheet format with the possibility of choosing the decimal separator, the column separator as well as the timestamping format can be selected.

[DESCENT]									
(AM) (SD) (MD)									
2015-06-15	08:34:51	;	4.90;	17.4640;	35.798;	0.0000;	0.0000;	4.90;	17.4640;35.798
2015-06-15	08:34:51	;	5.50;	17.4600;	35.797;	0.0030;	0.0000;	5.50;	17.4600;35.797
2015-06-15	08:34:51	;	6.40;	17.4530;	35.797;	0.0030;	0.0000;	6.40;	17.4530;35.797

2015-06-15	08:34:51	;	8.50;	17.4380;	35.796;	0.0030;	0.0000;	8.50;	17.4360;35.796
2015-06-15	08:34:51	;	9.50;	17.4320;	35.796;	0.0030;	0.0000;	9.50;	17.4290;35.796

6.4. Recording in binary format

6.4.1. Encoding format

The data is saved in "little endian" format with byte alignment objects:

- **BYTE** - char (1 byte)
- **SHORTINT** - short integer (2 bytes)
- **LONGINT** - long integer (4 bytes)
- **EPOCH** – absolute timestamping (4 bytes) - Unix Epoch format - January 1st, 1970 at 00:00
- **FLOAT** - floating (4 bytes - float) – IEEE-754 format

6.4.2. File structure

Each file begins with an encoding identifying byte:

- 0x01: SBE41 sensor - Extended format
- 0x02: SBE41 sensor - Standard format
- 0x03: DO sensor
- 0x04: OCR504 sensor (4 channels)
- 0x05: OCR507 sensor (7 channels)
- 0x06: OCR507-IR sensor (14 channels)
- 0x07: ECO1 sensor (1 channel)
- 0x08: ECO2 sensor (2 channels)
- 0x09: ECO3 sensor (3 channels)
- 0x0A: CROVER sensor
- 0x0B: SBEPH sensor
- 0x0C: SUNA sensor (45 outputs spectrum)
- 0x0D: SUNA sensor (90 outputs spectrum)
- 0x0E: UVP6 sensor (LPM data)
- 0x0F: None
- 0x10: None
- 0x11: UVP6 sensor (BLACK data)
- 0x12: ECO1v2 sensor (1 channel)
- 0x13: ECO2v2 sensor (2 channels)
- 0x14: ECO3v2 sensor (3 channels)
- 0x15: ECO4v2 sensor (4 channels)
- 0x16: EXTTRIG sensor
- 0x17: RAMSES sensor
- 0x18: OPUS sensor (LIGHT data)
- 0x19: OPUS sensor (BLACK data)
- 0x1A: MPE sensor
- 0x1B: UVP6 sensor (LPMv2 data)
- 0x1C: UVP6 sensor (TAXOv2 data)
- 0x1D: UVP sensor (BLACKv2 data)
- 0x1E: HYDROC sensor (M data)
- 0x1F: HYDROC sensor (C data)

- 0x20: RAMSES2 sensor
- 0x21: IMU sensor (raw data)
- 0x22: IMU sensor (tilt plus heading data)
- 0x23: WAVE sensor (raw data)

This is followed by groups of recordings identified by the tags.

Example: SBE41 standard format file, descent phase

00000000	01	5b 44 45 53 43 45 4e 54 5d 28 44 57 29 cb 65	[DESCENT] (DW) Ēe
00000010	e4	5b 00 00 12 04 c7 57 d6 8b 36 55 00 1e 04 c0	ä [. . . ÇWÖ< 6U . . . Ä
00000020	57	d6 8b 45 56 00 29 04 b2 57 d5 8b 13 80 00 36	WÖ< EV.) . *WÖ< . € . 6
00000030	04	ab 57 d4 8b 62 80 00 41 04 a4 57 d4 8b 61 80	. «WÖ< b€ . A. »WÖ< a€
00000040	00	4f 04 9d 57 d4 8b 50 80 00 5d 04 8e 57 d2 8b	. O. WÖ< P€ .] . ŽWÖ<
00000050	38	81 00 68 04 87 57 d1 8b 67 aa 00 74 04 80 57	8 . h. #WŃ< g² . t. €W

Note: In Iridium RUDICS transmission, files can be supplemented by padding bytes (0x1A). These bytes must not be decoded. Each file can end with a sequence of 0 to 1023 padding bytes.

6.4.3. Timestamping

Records can be timestamped with absolute timestamps (Unix Epoch format) or relative timestamps since a reference date.

Absolute timestamping is used for raw data records in parking phase (where the delay between records can be greater than hours). Data is encoded as follows:

- **Timestamp** absolute encoding (EPOCH)

Relative timestamping is used for the others records. The reference date is saved after the navigation phase tag. The following records use an offset (count in seconds) from this reference time. Data is encoded as follows:

- **Timestamp** offset in seconds (unsigned integer) – code = value - reference time

Example: Relative timestamping encoding

00000000	01 5b 44 45 53 43 45 4e 54 5d 28 44 57 29 cb 65	[DESCENT] (DW) Ēe
00000010	e4 5b 00 00 12 04 c7 57 d6 8b 36 55 00 1e 04 c0	ä [. . . ÇWÖ< 6U . . . Ä
00000020	57 d6 8b 45 56 00 29 04 b2 57 d5 8b 13 80 00 36	WÖ< EV.) . *WÖ< . € . 6
00000030	04 ab 57 d4 8b 62 80 00 41 04 a4 57 d4 8b 61 80	. «WÖ< b€ . A. »WÖ< a€
00000040	00 4f 04 9d 57 d4 8b 50 80 00 5d 04 8e 57 d2 8b	. O. WÖ< P€ .] . ŽWÖ<
00000050	38 81 00 68 04 87 57 d1 8b 67 aa 00 74 04 80 57	8 . h. #WŃ< g² . t. €W

Timestamp = 1541694923 (0x5BE465CB) + 0 sec (0x0000) => 2018-11-08 16:35:23

6.5.SBE41 sensor

6.5.1. Data encoding

Data is encoded as follows:

- **Timestamping** of each record
- **Pressure** in cbar and +100 dbar offset (unsigned integer) – code = (value + 100.0) * 10.0
- **Temperature** in m°C and +5.0°C offset (unsigned integer) – code = (value + 5.0) * 1000.0
- **Salinity** in mpsu (unsigned integer) – code = value * 1000.0
- **Temperature standard deviation** in m°C (signed integer) – code = value * 1000.0
- **Salinity standard deviation** in mpsu (signed integer) – code = value * 1000.0

6.5.2. Standard binary format

During the "descent" and "ascent" navigation phases, the first record of each processing area is timestamped in absolute value (reference date), then the recordings for the next records are timestamped in relative value by encoding the date in relation to the reference date (deviation in seconds).

During the "drift" phases, all records are timestamped in absolute value.

The recording structures are as follows:

Subsurface - (SS)

struct

```
{
  unsigned long int uliDateTime;
  unsigned short int uiPressure;
  unsigned short int uiATemperature;
  unsigned short int uiSalinity;
}
```

tSSStd;

Subsurface data encoding (ascent)				
Field	Format	Range	Resolution	Size (Byte)
Timestamp	EPOCH	-	1 sec	4
Subsurface record				
Pressure	SHORTINT	-100 to +2500 dbar	0.1 dbar	2
Temperature	SHORTINT	-5.0 to +40.0°C	0.001°C	2

Timestamp 1 = 1541694923 (0x5BE465CB) + 0 sec (0x0000) => 2018-11-08 16:35:23

Pressure 1 = 1042 (0x0412) => ((1042 / 10.0) - 100.0) = 4.2 dbar

Temperature 1 = 22471 (0x57C7) => ((22471 / 1000.0) - 5.0) = 17.471°C

Salinity 1 = 35798 (0xD68B) => (35798 / 1000.0) = 35.798 psu

Timestamp 2 = Timestamp 1 + 85 sec (0x0055) => 2018-11-08 16:36:48

...

6.5.3. Extended binary format

Advantages of this format compared to the standard version:

- Improved resolution of recordings (pressure and temperature)

During the "descent" and "ascent" navigation phases, the first record of each processing area is timestamped in absolute value (reference date), then the recordings for the next records are timestamped in relative value by encoding the date in relation to the reference date (deviation in seconds).

During the "drift" phases, all records are timestamped in absolute value.

The resolution extension for pressure and temperature measurements is encoded on a shared byte using masks, as follows:

- Pressure extension (0.01 dbar) = value & 0xF0
- Temperature extension (0.1 m°C) = value & 0x0F

The available recording structures are as follows:

Subsurface – (SS)

struct

```
{
    unsigned long int uliDateTime;
    unsigned short int uiPressure;
    unsigned short int uiTemperature;
    unsigned short int uiSalinity;
    unsigned char ucPTExtra;
}
```

tSSExt;

Subsurface data encoding (ascent)				
Field	Format	Range	Resolution	Size (Byte)
Timestamp	EPOCH	-	1 sec	4
Subsurface record				
Pressure	SHORTINT	-100 to +2500 dbar	0.1 dbar	2
Temperature	SHORTINT	-5.0 to +40.0°C	0.001°C	2
Salinity	SHORTINT	0.0 to +50.0 psu	0.001 psu	2
Pressure extra	BYTE_H	0.00 to 0.09 dbar	0.01 dbar	1
Temperature extra	BYTE_L	0.0000 to 0.0009°C	0.0001°C	
				11

Raw data (park) – (RW) or (DW)

```

struct
{
    unsigned long int uliDateTime;
    unsigned short int uiAveragePressure;
    unsigned short int uiAverageTemperature;
    unsigned short int uiAverageSalinity;
    unsigned char ucAveragePTExtra;
}
tRExtPark;

```

Raw data encoding (park phase)				
Field	Format	Range	Resolution	Size (Byte)

Timestamp 1 = 1541694923 (0x5BE465CB) + 0 sec (0x0000) => 2018-11-08 16:35:23

Pressure 1 = 1042 (0x0412) + 0.03 dbar (0x3_) => ((1042 / 10.0) – 100.0) + 0.03 = 4.23 dbar

Temperature 1 = 22471 (0x57C7) + 0.0006°C (0x_6) => ((22471 / 1000.0) – 5.0) + 0.006 = 17.4716°C

Salinity 1 = 35798 (0xD68B) => (35798 / 1000.0) = 35.798 psu

Timestamp 2 = Timestamp 1 + 85 sec (0x0055) => 2018-11-08 16:36:48

...

6.6.D0 sensor

Data is encoded as follows:

- **Timestamping** of each record
- **Pressure** in cbar and +100 dbar offset (unsigned integer) – code = (value + 100.0) * 10.0
- **Phase** in degrees (float) – code = value
- **Temperature** in m°C and +5.0°C offset (unsigned integer) – code = (value + 5.0) * 1000.0
- **Phase standard deviation** in degrees (signed integer) – code = value * 1000.0
- **Temperature standard deviation** in m°C (signed integer) – code = value * 1000.0

During the "descent" and "ascent" navigation phases, the first record of each processing area is timestamped in absolute value (reference date), then the recordings for the next records are timestamped in relative value by encoding the date in relation to the reference date (deviation in seconds).

During the "drift" phases, all records are timestamped in absolute value.

The available recording structures are as follows:

Raw data (park) – (RW) or (DW)

struct

```
{
    unsigned long int uliDateTime;
    unsigned short int uiPressure;
    float fC1RPhase;
    float fC2RPhase;
    unsigned short int uiTemperature;
}
```

tRPark;

Raw data encoding (park)

6.7.OCR sensor

Data is encoded as follows:

- **Timestamping** of each record
- **Pressure** in cbar and +100 dbar offset (unsigned integer) – code = (value + 100.0) * 10.0
- **Channel count** (unsigned long int) – code = value
- **Channel count standard deviation** (signed long int) – code = value

Data record can be composed of counts from 4, 7 or 14 channels (depending on the sensor's configuration).

During the "descent" and "ascent" navigation phases, the first record of each processing area is timestamped in absolute value (reference date), then the recordings for the next records are timestamped in relative value by encoding the date in relation to the reference date (deviation in seconds).

During the "drift" phases, all records are timestamped in absolute value.

The available recording structures are as follows:

Raw data (park) – (RW) or (DW)

struct

```
{
  unsigned long int uliDateTime;
  unsigned short int uiPressure;
  unsigned long int uliCountChannel1;
  unsigned long int uliCountChannel2;
  [...]
  unsigned long int uliCountChannelN;
}
```

tRPark;

4 channels - Raw data encoding (park)

6.8.ECO sensor

Data is encoded as follows:

- **Timestamping** of each record
- **Pressure** in cbar and +100 dbar offset (unsigned integer) – code = (value + 100.0) * 10.0
- **Channel count** (signed short int) – code = value
- **Channel count standard deviation** (signed char) – code = value

Data record can be composed of counts from 1 to 3 channels (depending on the sensor's configuration).

During the "descent" and "ascent" navigation phases, the first record of each processing area is timestamped in absolute value (reference date), then the recordings for the next records are timestamped in relative value by encoding the date in relation to the reference date (deviation in seconds).

During the "drift" phases, all records are timestamped in absolute value.

The available recording structures are as follows:

Raw data (park) – (RW) or (DW)

```
struct

6.10. CROVER sensor

Data is encoded as follows:

- **Timestamping** of each record
- **Pressure** in cbar and +100 dbar offset (unsigned integer) – code = (value + 100.0) * 10.0
- **Corrected signal raw count** (signed short int) – code = value
- **Corrected signal raw count standard deviation** (signed short int) – code = value

During the "descent" and "ascent" navigation phases, the first record of each processing area is timestamped in absolute value (reference date), then the recordings for the next records are timestamped in relative value by encoding the date in relation to the reference date (deviation in seconds).

During the "drift" phases, all records are timestamped in absolute value.

The available recording structures are as follows:

Raw data (park) – (RW) or (DW)

```
struct
{
    unsigned long int uliDateTime;
    unsigned short int uiPressure;
    signed short int iCorrectedSignalRawCount;
}

6.11. SBEPH sensor

Data is encoded as follows:

- **Timestamping** of each record
- **Pressure** in cbar and +100 dbar offset (unsigned integer) – code = (value + 100.0) * 10.0
- **Voltage** in μV (signed long int) – code = (value * 1000000.0)
- **Voltage standard deviation** in μV (signed char) – code = (value * 1000000.0)

During the "descent" and "ascent" navigation phases, the first record of each processing area is timestamped in absolute value (reference date), then the recordings for the next records are timestamped in relative value by encoding the date in relation to the reference date (deviation in seconds).

During the "drift" phases, all records are timestamped in absolute value.

The available recording structures are as follows:

Raw data (park) – (RW) or (DW)

```

...

6.12. SUNA sensor

Data is encoded as follows:

- **Timestamping** of each record
- **Pressure** in cbar and +100 dbar offset (unsigned integer) – code = $(\text{value} + 100.0) * 10.0$
- **Temperature** in m°C and +5.0°C offset (unsigned integer) – code = $(\text{value} + 5.0) * 1000.0$
- **Salinity** in mpsu (unsigned integer) – code = $\text{value} * 1000.0$
- **Humidity** in % (unsigned char) – code = $(\text{value} * 2.0)$
- **Dark mean** (unsigned short int) – code = $(\text{value} * 10.0)$
- **Dark standard deviation** (signed short int) – code = $(\text{value} * 100.0)$
- **Nitrate concentration** in µM (float) – code = value
- **Absorbance fit residual RMS** (float) – code = value
- **Output spectrum** (unsigned short int) – code = value

Data record can be composed of output spectrum from 45 or 90 channels (depending on the sensor's configuration).

During the "descent" and "ascent" navigation phases, the first record of each processing area is timestamped in absolute value (reference date), then the recordings for the next records are timestamped in relative value by encoding the date in relation to the reference date (deviation in seconds).

During the "drift" phases, all records are timestamped in absolute value.

The available recording structures are as follows:

6.13. UVP6 sensor (LPMv2)

Data is encoded as follows:

- **Timestamping** of each record
- **Pressure** in cbar and +100 dbar offset (unsigned integer) – code = (value + 100.0) * 10.0
- **Number of images** in the record (unsigned char) – code = value
- **Temperature int.** in m°C and +5.0°C offset (unsigned integer) – code = (value + 5.0) * 1000.0
- **Number of particles per size class** (float) – code = value
- **Mean grey level per size class** (unsigned char) – code = value

During the "descent" and "ascent" navigation phases, the first record of each processing area is timestamped in absolute value (reference date), then the recordings for the next records are timestamped in relative value by encoding the date in relation to the reference date (deviation in seconds).

During the "drift" phases, all records are timestamped in absolute value.

Raw data (park) – (RW) or (DW)

struct

6.14. UVP6 sensor (TAX0v2)

Data is encoded as follows:

- **Timestamping** of each record
- **Pressure** in cbar and +100 dbar offset (unsigned integer) – code = (value + 100.0) * 10.0
- **Number of images** in the record (unsigned char) – code = value
- **Number of object** in the record (unsigned char) – code = value (1 to 40 max.)
- **Object number** in the record (unsigned char) – code = value (1 to 255)
- **Object index** (unsigned char) – code = value (0 to 39)
- **Mean size per an object** (float) – code = value
- **Mean grey level per an object** (unsigned char) – code = value

During the "descent" and "ascent" navigation phases, the first record of each processing area is timestamped in absolute value (reference date), then the recordings for the next records are timestamped in relative value by encoding the date in relation to the reference date (deviation in seconds).

During the "drift" phases, all records are timestamped in absolute value.

This data type has the particularity to use a variable size record. Each record could have different size. The size of the packet is determinate by the field "number of object".

Raw data (park) – (RW) or (DW)

struct

```

6.17. RAMSES/RAMES2 sensor

Data is encoded as follows:

- **Timestamping** of each record
- **Pressure** in cbar and +100 dbar offset (unsigned integer) – code = (value + 100.0) * 10.0
- **Integration time** (unsigned integer) – code = value
- **Depth** in cbar and +100 dbar offset (unsigned integer) – code = (value + 100.0) * 20.0
- **Inclination** in cdegree (unsigned integer) – code = (value + 100.0) * 10.0
- **Dark average** (unsigned integer) – code = value
- **Number of spectrum channels** (unsigned char) – code = value
- **Spectrum channels count** (unsigned integer) – code = value (spectrum size is not constant)

During the "descent" and "ascent" navigation phases, the first record of each processing area is timestamped in absolute value (reference date), then the recordings for the next records are timestamped in relative value by encoding the date in relation to the reference date (deviation in seconds).

During the "drift" phases, all records are timestamped in absolute value.

[...]

Timestamp 2 = Timestamp 1 + 2 sec (0x0002) => 2020-03-30 12:26:38

6.18. OPUS sensor (LIGHT)

Data is encoded as follows:

- **Timestamping** of each record
- **Pressure** in cbar and +100 dbar offset (unsigned integer) – code = $(\text{value} + 100.0) * 10.0$
- **Spectrum type** (char) – code = '2' for calibrated spectrum and '4' for raw light spectrum
- **Averaging** (unsigned char) – code = $\text{value} * 10$
- **Flash count** (unsigned char) – code = $\text{value} * 10$
- **Internal temperature** in m°C and +5.0°C offset (unsigned integer) – code = $(\text{value} + 5.0) * 1000.0$
- **Number of spectrum channels** (unsigned char) – code = value
- **Spectrum channels count** (unsigned integer) – code = value (spectrum size is not constant)

During the "descent" and "ascent" navigation phases, the first record of each processing area is timestamped in absolute value (reference date), then the recordings for the next records are timestamped in relative value by encoding the date in relation to the reference date (deviation in seconds).

During the "drift" phases, all records are timestamped in absolute value.

Raw data (park) – (RW) or (DW)

6.20. MPE sensor

Data is encoded as follows:

- **Timestamping** of each record
- **Pressure** in cbar and +100 dbar offset (unsigned integer) – code = (value + 100.0) * 10.0
- **Voltage** in xV (float) – code = value
- **Temperature** in m°C and +5.0°C offset (unsigned integer) – code = (value + 5.0) * 1000.0

During the "descent" and "ascent" navigation phases, the first record of each processing area is timestamped in absolute value (reference date), then the recordings for the next records are timestamped in relative value by encoding the date in relation to the reference date (deviation in seconds).

During the "drift" phases, all records are timestamped in absolute value.

The available recording structures are as follows:

Raw data (park) – (RW) or (DW)

```
struct
{
    unsigned long int uliDateTime;
    unsigned short int uiPressure;
    float fVoltage;
    unsigned short int uiTemperature;
}
tRPark;
```

Raw data encoding (park)

6.21. HYDROC sensor (M or C)

Data is encoded as follows:

- **Timestamping** of each record
- **Pressure** in cbar and +100 dbar offset (unsigned integer) – code = $(\text{value} + 100.0) * 10.0$
- **Acquisition mode**: 0 = warm-up, 1 = zero, 2 = flush and 3 = measure (byte) – code = value
- **Raw signal** (unsigned integer) – code = value
- **Pressure** (internal) in mbar and -750 mbar offset (unsigned integer) – code = $(\text{value} - 750.0) * 100.0$
- **Temperature** in m°C and +5.0°C offset (unsigned integer) – code = $(\text{value} + 5.0) * 1000.0$
- **Humidity** in % (unsigned integer) – code = $\text{value} * 200.0$
- **Pump power** in W (unsigned char) – code = $\text{value} * 100.0$
- **Supply voltage** in V (unsigned char) – code = $\text{value} * 10.0$
- **Total current** in mA (unsigned integer) – code = $\text{value} * 10.0$
- **Runtime** in sec (unsigned long integer) – code = value

During the "ascent" navigation phase, the first record of each processing is timestamped in absolute value (reference date), then the recordings for the next records are timestamped in relative value by encoding the date in relation to the reference date (deviation in seconds).

During the "drift" phases, all records are timestamped in absolute value.

6.22. IMU sensor (R)

Data is encoded as follows:

- **Timestamping** of each record
- **Pressure** in cbar and +100 dbar offset (unsigned integer) – code = (value + 100.0) * 10.0
- **Temperature** (internal) raw value (signed integer) – code = value
- **Acceleration** raw value (signed integer) – code = value
- **Angular rate** raw value (signed integer) – code = value
- **Magnetic field** raw value (signed integer) – code = value

During the "ascent" navigation phase, the first record of each processing is timestamped in absolute value (reference date), then the recordings for the next records are timestamped in relative value by encoding the date in relation to the reference date (deviation in seconds).

During the "drift" phases, all records are timestamped in absolute value.

Timestamp = 1655221045 (0x62A8AB35) => 2022-06-16 14 15:37:25
Pressure = 1175 (0x0497) => ((1175 / 10.0) – 100.0) = 17.5 dbar
Accelerometer X = - 376 (0xFE88)
[...]

6.23. IMU sensor (TH)

Data is encoded as follows:

- **Timestamping** of each record
- **Pressure** in cbar and +100 dbar offset (unsigned integer) – code = (value + 100.0) * 10.0
- **Tilt** angle in degrees (unsigned char) is coded using a changing resolution mechanism (128 coding values). The aim is to ensure high resolution when tilt angle value is small while keeping a wide coding range [0.0 to +52.0].

Tilt_code = code & 0x7F

Value in range [0.0 to 5.0], 0.1 degree resolution: Tilt_code = ((value – 0) * 10) + 0

Value in range [5.2 to 10.0], 0.2 degree resolution: Tilt_code = ((value – 5) * 5) + 50

Value in range [10.5 to 20.0], 0.5 degree resolution: Tilt_code = ((value – 10) * 2) + 75

Value in range [21.0 to 52.0], 1.0 degree resolution: Tilt_code = ((value – 20) * 1) + 95

- **Heading sign** is coded in the 8th bit of the Tilt: if heading is negative => code & 0x80 = 0x80
- **Heading angle** in degrees (unsigned char) – code = value

During the "ascent" navigation phase, the first record of each processing is timestamped in absolute value (reference date), then the recordings for the next records are timestamped in relative value by encoding the date in relation to the reference date (deviation in seconds).

During the "drift" phases, all records are timestamped in absolute value.

Raw data (park) – (RW) or (DW)

struct

```
{
    unsigned long int uliDateTime;
    unsigned short int uiPressure;
    unsigned char ucTilt;
    unsigned char ucHeading;
}
```

tRPark;

Raw data encoding (park)				
Field	Format	Range	Resolution	Size (Byte)
Timestamp	EPOCH	-	1 sec	4
Raw record				
Pressure	SHORTINT	-100 to +2500 dbar	0.1 dbar	2
Tilt	BYTE	0.0 to +52.0 deg	changing	1
Heading	BYTE	-180.0 to +180.0 deg (*)	1.0 deg	1
				8

Raw data (navigation) – (RW) or (DW)/Averaged data – (AM)

struct

```
{
    unsigned short int uiDateTimeDelta;
    unsigned short int uiPressure;
    unsigned char ucTilt;
    unsigned char ucHeading;
}
```

tRNav/tM;

Raw data encoding (navigation)/ Average data encoding				
Field	Format	Range	Resolution	Size (Byte)
Timestamp	SHORTINT	0 to +65535	1 sec	2
Raw record/Average record				
Pressure	SHORTINT	-100 to +2500 dbar	0.1 dbar	2
Tilt	BYTE	0.0 to +52.0 deg (*)	changing	1
Heading	BYTE	-180.0 to +180.0 deg (*)	1.0 deg	1
				6

(*) Heading sign is coded in the tilt angle 8th bit.

Example:

[ASCENT]

 Pressure = 10994 (0x2AA2) => $((10994 / 10.0) - 100.0) = 991.4$ dbar
 Heading sign = test negative flag (0x81 & 0x80 mask) = 0x80 => negative
 Tilt = 1 (0x01 = 0x81 & 0x7F mask) => $((1 - 0) / 10) - 0 = 0.1^\circ$
 Heading = 96 (0x60) => - 96° (with negative flag)

6.24. WAVE sensor (R)

Data is encoded as follows:

- **Timestamping** of the record
- **Acceleration** raw value (signed integer) – code = value
- **Magnetic field** raw value (signed integer) – code = value

During the "surface" navigation phase, a burst record of N points is achieved at 4 Hz.

Raw data (surface) – (RW)

struct

```
{
    unsigned long int uliDateTime;
    unsigned short int uiN;
    signed short int iAccelerometerX1;
    signed short int iAccelerometerY1;
    signed short int iAccelerometerZ1;
    signed short int iMagnetometerX1;
    signed short int iMagnetometerY1;
    signed short int iMagnetometerZ1;
    [...]
    signed short int iAccelerometerXN;
